

File 1: Sub-Phase 3.1 — Problem-Solution Mapping

PHASE 3: DESIGN & SOLUTION ARCHITECTURE

Sub-Phase 3.1: Problem-Solution Mapping

Field	Details
Date	28-09-2026
Team ID	SWTID-2026-8733
Project Name	Implement Client Script & UI Policy (Incident)
Document Type	Sub-Phase Deliverable 3.1 — Problem-Solution Mapping

1. Executive Design Overview

The Problem-Solution Mapping phase connects operational pain points identified in earlier stages directly to technical ServiceNow mechanisms. Mapping each problem to either a **UI Policy** or a **Client Script** ensures a clear rationale for every platform configuration choice.

2. Problem to Technical Solution Matrix

Problem ID	Operational Defect / Pain Point	Root Cause	Selected Technical Solution	Mechanism & API
PS-01	High-impact incidents are saved without an Assignment group.	Lack of dynamic mandatory field rules on the form.	UI Policy	Condition: Impact = 1 - High Action: Assignment group -> Mandatory = True.
PS-02	Urgency is not updated when Impact changes to High, causing incorrect priority.	No automated field sync between Impact and Urgency.	onChange Client Script	Field: impact API: g_form.setValue('urgency', '1') & g_form.addInfoMessage().
PS-03	Agents manually alter auto-calculated Urgency values.	Field remains editable after auto-population.	UI Policy	Condition: Impact = 1 - High Action: Urgency -> Read-Only = True.
PS-04	High-impact tickets are submitted without an Assigned to user.	Missing submission-level validation checks.	onSubmit Client Script	Logic: Checks impact == 1 && assigned_to == ". API: g_form.showErrorBox() & return false.

Problem ID	Operational Defect / Pain Point	Root Cause	Selected Technical Solution	Mechanism & API
PS-05	Direct editing of ticket State from List View bypasses form workflows.	List View inline editing is enabled by default.	onCellEdit Client Script	Field: state API: alert() prompt & callback(false).
