PHASE 3: DESIGN & SOLUTION ARCHITECTURE

Sub-Phase 3.3: Solution Architecture

Field	Details
Date	28-09-2026
Team ID	SWTID-2026-8733
Project Name	Implement Client Script & UI Policy (Incident)
Document Type	Sub-Phase Deliverable 3.3 — Solution Architecture

1. Architectural Concept

The Solution Architecture illustrates how ServiceNow browser engines process client-side logic in real time, validating user interactions on the client layer before committing transactions to the enterprise database.

2. Architectural Workflow Diagram

[SERVER DATABASE LAYER: Incident Table]

3. Execution Layer Interaction Matrix

Architecture Layer	Component / Engine	Responsibility	Execution Order / Priority
Client UI Layer	Incident Form / List View	Captures user keyboard/mouse events on incident fields.	Step 1: User Action Triggered
Declarative Engine	UI Policy Engine	Evaluates Impact = 1 - High condition; updates field mandatory/read-only states.	Step 2: Runs after Client Scripts during form changes
Programmatic Engine	Client Script Engine	Executes JavaScript logic for onChange, onSubmit, and onCellEdit events via g_form API.	Step 3: Event-driven script execution
Database Server Layer	ServiceNow Database (incident)	Receives validated record payloads and executes database commit.	Step 4: Final Database Write (Only if client checks pass)
