

File 1: Sub-Phase 1.1 — Define Problem
PHASE 1: BRAINSTORMING AND IDEATION

Sub-Phase 1.1: Define Problem Report

Field	Details
Date	28-09-2026
Team ID	SWTID-2026-8733
Project Name	Implement Client Script & UI Policy (Incident)
Document Type	Sub-Phase Deliverable 1.1 — Problem Definition

1. Executive Problem Statement

In enterprise IT Service Management (ITSM), the incident table serves as the primary operational entry point for handling service disruptions. However, manual data entry on incident forms introduces human errors, inconsistent field synchronization, and unauthorized list-level edits. Without instant client-side validation, incomplete or incorrectly prioritized tickets enter the system, leading to delayed ticket routing, SLA breaches, and increased operational overhead.

2. Core Operational Pain Points

Problem Domain	Root Cause / Technical Defect	Operational & Business Impact
Incomplete High-Impact Incident Creation	High-impact incidents (Impact = 1 - High) are often created without mandatory Assignment group or Assigned to users.	Unassigned critical tickets sit in queue without ownership, directly causing SLA response breaches.
Inconsistent Impact-Urgency Synchronization	Setting Impact to 1 - High does not automatically sync Urgency to 1 - High, relying on manual agent adjustment.	Inconsistent matrix calculation for Priority (Impact x Urgency), leading to misclassified ticket urgency.
Bypassing Form-Level Data Governance	Service Desk agents perform inline edits on the State field directly from the List View.	Bypasses mandatory form-level validation rules and workflow requirements needed during state changes.

Problem Domain	Root Cause / Technical Defect	Operational & Business Impact
Delayed Server-Side Error Feedback	Field validation errors are checked on the server after submission rather than in real time on the browser.	Slow submission response cycles, extra network overhead, and poor agent user experience.

3. Problem Definition & Objectives Matrix

Objective ID	Target Problem	Proposed Solution Mechanism
OBJ-01	Missing Assignment group on high-impact incidents.	Enforce dynamic mandatory rule on Assignment group using ServiceNow UI Policy when Impact = 1 - High.
OBJ-02	Manual Urgency selection and priority mismatch.	Auto-populate Urgency to 1 - High via onChange Client Script and set field to Read-Only via UI Policy.
OBJ-03	Submitting critical tickets without an assigned user.	Intercept form submission using onSubmit Client Script to block save if Assigned to is empty.
OBJ-04	Direct list-view editing of ticket status.	Block inline cell editing on State column using onCellEdit Client Script.
